## Health Advisory

To: Healthcare Providers

From: Andy Miller, M.D. (signed original on file)

Date: August 12, 2019

Re: West Nile Virus (WNV) is here in Butte County \*(CORRECTED)

---

Butte County Public Health Department (BCPHD) has identified the first case of human WNV infection for the 2019 season. As of August 9, 2019, CDPH reports 10 WNV infections in CA residents, not including the Butte County case just identified. West Nile Virus typically circulates July through October in California, peaking in August in Butte County. BCPHD would like to remind local providers that endemic West Nile Virus (WNV) continues to affect Butte County residents each year.

Since 2015, a total of 90 Butte County residents have been reported with WNV illness: 53 cases in 2015, 21 in 2016, 4 in 2017 and 12 in 2018. The number of cases of WNV fluctuates unpredictably because disease incidence is affected by a multitude of factors, including mosquito populations, acres of flood-irrigated farmland, avian amplifying host populations, human behavior, and weather (e.g., temperature, rainfall). Butte County consistently has some of the highest annual rates of WNV illness in CA.

### Who Should Be Tested for WNV

Medical providers should order WNV testing from April through November for all patients presenting with the following clinical syndromes:

- Encephalitis
- Aseptic meningitis
- Acute flaccid paralysis; atypical Guillain-Barré Syndrome; transverse myelitis, or
- Febrile illness ( $T \geq 38^{\circ}\text{C}$  for  $> 7$  days) compatible with WNV. Other symptoms may include headache, rash, swollen lymph nodes, eye pain, nausea or vomiting. Fatigue and lethargy may persist for a prolonged period of time after initial symptoms.

### Testing Information

Laboratory diagnosis is usually done by testing serum or cerebrospinal fluid (CSF) for WNV-specific antibodies. Enzyme Immunoassay (EIA) antibody test for WNV IgG and IgM is the preferred initial test. For testing, an acute serum specimen ( $\geq 2$  cc) is required or, if lumbar puncture performed, 1-2 cc CSF. (Note: PCR testing is available but not recommended for clinical diagnostic purposes due to the low sensitivity of the test and resulting unacceptably high number of false-negative results. A negative PCR test does not rule out WNV infection.)

WNV IgM antibodies are usually detectable 3-8 days after onset of illness. In the absence of a positive IgM result, a positive IgG result only indicates previous infection. If specimens were collected within 8 days of symptom onset, false-negatives are possible. If WNV is highly suspected, repeat the test in 3-5 days after the initial specimen collection.

## Why Test for WNV

- Testing differentiates WNV from other conditions (enterovirus, other arboviral diseases)
- Mosquito control and public health agencies can institute enhanced surveillance and control measures to help prevent additional cases
- Testing results offer anticipatory guidance - patients with WNV neuroinvasive or non-neuroinvasive disease can have lingering symptoms and knowing the underlying etiology is helpful for the patient and family members

## When to Consider St. Louis Encephalitis

St. Louis encephalitis virus (SLEV) has recently re-emerged in California. Like WNV infection, SLEV infection is usually mild or asymptomatic but can cause severe neurologic illness. In 2017, there were 4 human cases of SLEV in CA, including 1 in Butte County. As of August 9, 2019, there have been no human cases of SLEV reported in CA this season; however, 5 counties have detected SLEV in mosquitoes.

SLEV is transmitted by the same mosquitoes as WNV. This virus is closely related to WNV, and most commercial assays are unable to distinguish between these two infections. The most reliable way to distinguish them is via plaque reduction neutralization test (PRNT). **Once SLEV has been detected in Butte County in non-human sources, all reported cases of WNV will require PRNT to differentiate between the two diseases.** Once SLEV is detected in Butte County, BCHD will work with providers to coordinate confirmatory PRNT for WNV positive patients.

## Reporting

WNV infection is a reportable disease. The California Code of Regulations, section 2500, require providers to report all positive acute laboratory findings and clinical cases of WNV to the local health department where the patient resides within one working day of identification.

All cases of acute encephalitis and meningitis regardless of etiology are also reportable within one working day.

A Confidential Morbidity Report (CMR) can be used to file a report. The CMR should be **faxed** to BCPHD at: Chico 530-879-3309, or Oroville 530-538-5387. Providers who have signed up to report electronically via Provider Portal can submit a web CMR on-line via CalREDIE. For questions regarding WNV or this Health Advisory, providers can call BCPHD's Communicable Diseases at 530-552-3929.

Under Title 17, California Code of Regulations (CCR), failure to report is a misdemeanor (Health and Safety Code § 120295) and is a citable offense under the Medical Board of California's Citation and Fine Program (Title 16, CCR, § 1364).

## Categories of urgency levels:

**Health Alert:** conveys the highest level of importance; warrants immediate action or attention

**Health Advisory:** provides important information for a specific incident or situation; may not require immediate action

**Health Update:** provides updated information regarding an incident or situation; unlikely to require immediate action
